KEYINCODE KIC5505PK With Wi-Fi KeyInCloud

No more wasting time on costly lockouts and lost keys. The versatile KIC5500 Exit Trim from KeyinCode offers Bluetooth and multiple keyless lock access methods without having to fumble around with traditional keys. Users can access the lock through keypad code entry, a tap of their smart card, or their smartphone. Managing multiple locks has never been easier thanks to the free K3 Connect app, which allows admins to create and share user access rights as well as customize lock functions right from their compatible Bluetooth smartphone.

Schedule specific time periods for code-free access allowing guests to open the door without having to use any credentials, perfect for open business and delivery hours. Start the business day off right with the First Man In function, which keeps the door locked during a scheduled passage period until the first valid credential is used to open the lock, then remains open for the rest of that period. This ensures your building or room is only open when a registered user is there to open the doors. Audit trails can also be viewed from the smartphone to see who is accessing the lock and when. Whether it's an emergency situation or the occupant just needs some privacy, lockdown can be engaged to prevent user access so only an admin can open the lock. For sensitive or higher security applications, the KIC5500PK is also equipped with dual-credential verification which requires at least two valid users to open the lock.
